

## Pump and Valve Controls

The Propel Electric Pump and Valve control panels are designed to have no weak links in the system. The individual panels are connected to a particular number of valves, and with standard rugged data communication the position of the valves and efficiency of the pumps is centrally displayed on multiple stations.

With a valve connected to the system, not only can a full open or closed position be indicated but also its percentile of gap. The logical drive of the valves can be designed to automatically permit a pump to be started when and only when a set combination of valves is open.

Additional Highlights of the Pump and Valve Controls:

- For up to 300 valves and 16 pumps
- 24VDC control power even when black out conditions are present
- Building block design
- Universal valve connection
- Safety lockouts with password protection
